filtration products for over 35 years

## CS & S Filtration Tri-Coat Pre-Coat Material

### Available in:

- **30 lb. Bags**
- **1000 lb. Super Sacks**
- **20000 lb. PD Truck**

We recommend the use of our pre-coat material to establish a **inert** dust cake on the bag prior to start up of the system.

- This material is blended to allow for a light-weight mixture of porous dust that is dry and flow-able.

This will pre-coat the textile so that the initial dust cake can't catch on the raw textile fibers and start blinding or attacking the bags.

This material should be added at a rate of **10 pounds for every 100 ft<sup>2</sup> of filter cloth.**

- Pre-coat material is fed into the inlet duct of the dust collection system utilizing the main ID fan as suction for the material.
- In a positive pressure dust collection system the material must be blown in. These positive systems are normally large and a PD truck is used to convey the pre-coat.
- Contact your CS & S representative for details.
